Decision Notes

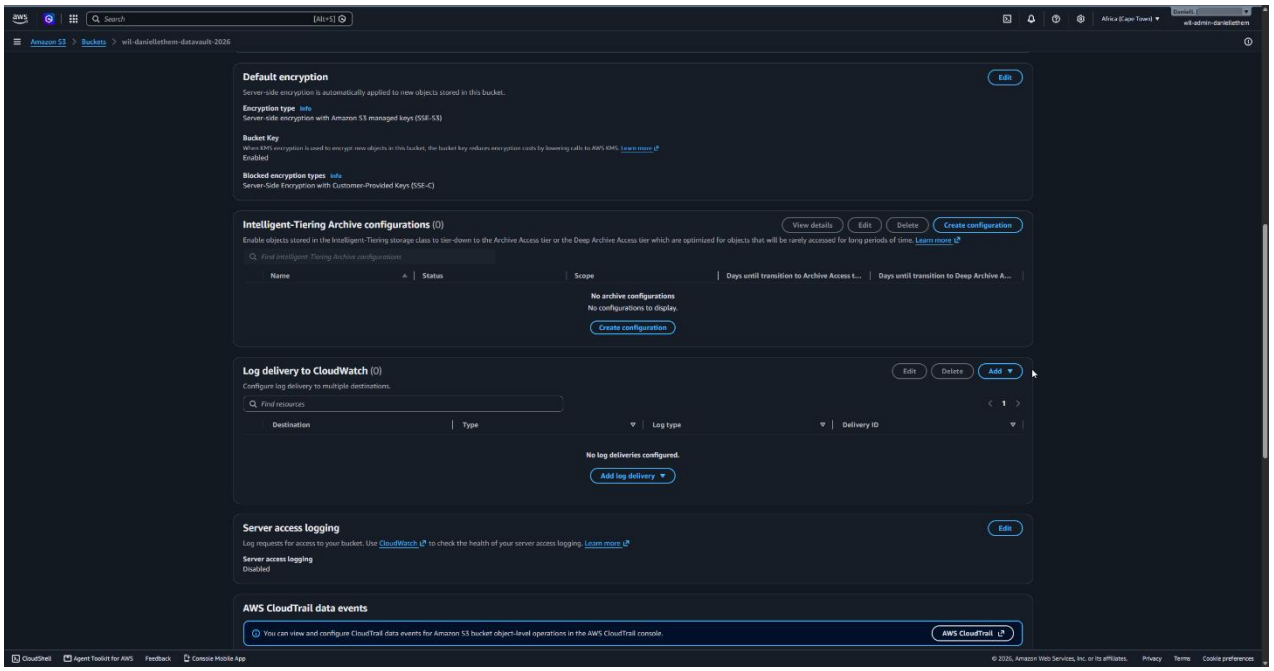

- **Root Protection**: Account is reinforced as the root user account is locked down with multi-factor authentication using the Ente Auth application.
- **Cost**: A budget was created and configured with an 80% threshold and 100% threshold of $10 USD to avoid being charged unexpectedly.
- **Learning Platform Choice**: AWS Skill Builder was chosen as it allows guided labs and has hands-on activities.
- **IAM User**: The user “wil-admin-daniellethem” was created to ensure that the root user was not a single point of failure security-wise.
- **Region**: af-south-1 was used where possible as it is important to have the region in your working location for latency and compliance reasons.

The security group “wil-daniellethem-edge-sg” has been created.

Rule Justifications:

- HTTP (Port 80): This was exposed as it allows inbound public web traffic for unencrypted HTTP access.
- HTTPS (Port 443): This was exposed as it allows encrypted and secure inbound web traffic access via protocols such as SSL or TLS.

Differences between an SG and NACL

Feature	Security Group	Network Access Control List
Scope	It operates at an instance's level.	It operates at a subnet's level.
Stateful or Stateless	It is stateful as returned traffic is automatically allowed through regardless of the inbound and outbound rules.	It is stateless as returned traffic is only allowed by rules in both directions.
Rule Evaluation	All rules are evaluated before traffic is allowed through.	All rules are evaluated in a numerical order from lowest to highest and stops at a first match.
Traffic Filtering	Only allow rules are supported.	Both allow and deny rules are supported.

This means that SGs only act as a virtual firewall for individual instances while NACLs act as an added-on firewall layer that guards an entire subnet.
